

Completing the Computer Science program has strengthened both my technical knowledge and my confidence as a software developer. Throughout the program, I have developed skills in software engineering, database design, algorithms, data structures, security, and professional communication while applying these concepts through hands-on projects. Developing my ePortfolio has given me the opportunity to reflect on my growth, showcase what I believe is my strongest work, and demonstrate how my coursework has prepared me to contribute effectively in the computer science field. Some of the artifacts and things I have worked on throughout the program besides the three I chose to enhance are the full stack application I made in CS-465, the three dimensional recreation I did in CS-330, and the work I did throughout CS-250. In CS-465 I designed and developed a full stack application through the utilization of JavaScript and HTML. I was responsible for developing a database as well as the code that interfaces my application to the database. In CS-330 I created realistic, interactive three-dimensional objects through the use of application programming interface (API) libraries and best practices. The project for the class was to recreate something in real life for example a table or desk in 3D. In CS-250 I explored the stages of the Software Development Lifecycle through the lens of a developer and tester to examine the characteristics, documentation, and purpose of each stage. Through applying SDLC stages within an agile development environment, I was able to learn the principles used to develop high quality software while also assessing the impact of communication, documentation, and ethics on the SDLC. I also learned how to collaborate in a team environment, and communicate with stakeholders.

The artifacts I enhanced are an inventory app from my CS-360 class, a contact management service that tests everything with JUnit tests from my CS-320 class, and finally my database database management system for the animals in an animal shelter through the use of

CRUD from my CS-340 class. These artifacts each showcase a part of the computer science program, being software design and engineering, algorithms and data structures, and databases.
